

Air Control Display

The ACD is a 57 mm standard size multi-function display that can be used to reduce the number of instruments on your panel giving an Altimeter and control of a radio or transponder all in one instrument.

It is a ETSO'd electronic altimeter that can also be used as an altitude encoder for a transponder.

It can be connected to a radio to act as a remote control unit for the radio. This can be useful in two-seat gliders, or if you wish to mount the radio remotely due to space issues behind the panel. Currently the [Air Com](#) , [Becker 62XX](#) and [TQ Avionics KRT2](#) radios are supported.

It can also be connected to a transponder to act as a remote control unit for the transponder and radio. This again allows for the transponder unit to be mounted remotely. Currently the popular [Trig TT21 and 22](#) transponders and the [Garrecht VT-01](#) transponders are supported.

The ACD57 is customized via a license model so that you don't pay for what you don't need.
