

Be More Visible with an Anti-collision Strobe

The ACL can operate in two modes

1. Continuous - where the strobe light is always on
2. Automatic - where the strobe is triggered on by a flarm collision alert

This system has been used since 2012 in Schleicher gliders with the built-in LED strobe. The LX ACL is a control module only and needs to be connected to external LED's such as those available from Schleicher or [LXelektronik](#) .
